Description

We have experienced some issues with installing office in the standard way on laptops with Snapdragon Processors. This document will show you how to install office on these machines using Office Deployment Tool.

Note: If you have already attempted an office install on this machine, open task manager and close any tasks called "Office Click to Run" prior to completing the below.

Resolution

1. Go to the following link and down the Office Deployment Tool.
2. Once downloaded, run the file to extract the included setup.exe + config files
3. Move these files to C:\ODT (you may need to create this folder)
4. Download the .xml file attached to this KB and copy to this location as well
5. Run CMD as Administrator and run:
   cd C:\ODT (sets CMD to run from this location)
   setup.exe /download installOfficeBusRet64.xml (commences the download of Office)
6. **Keep CMD open**!
7. Wait for it to finish downloading (check if the C:\ODT\Office folder fills up... This file should be roughly 3GB in total)
8. If the machine you are deploying on is currently running Sophos, please ensure protection is paused as this can impact the download of the required installation files
9. Once the download appears to be completed, in the same CMD window, run:
   setup.exe /configure installOfficeBusRet64.xml (commences the download of Office)
10. The office install will begin to run. Be mindful that this will take 1-2 hours, sometimes longer, so be patient
11. You will be able to see the "Office Click to Run" task running in your task manager now, which confirms that this process is running correctly
12. Once the process is close to complete, you will see the standard office install window flash up, very quickly complete and close, which will mark that the installation is complete
13. You should now be able to access your office applications and complete the setup

Internal Memo
